

AI and Disadvantaged Communities in Germany: Risks and Opportunities

Advances in artificial intelligence (AI) promise productivity gains and new tools for communication, learning, and access to services. However, their impact on socio-economically or culturally disadvantaged groups can follow two very different trajectories. This report examines **Scenario 1**, in which AI might widen social divides by primarily benefiting those who are already advantaged, and **Scenario 2**, in which AI could become a tool to empower disadvantaged communities. Drawing on examples and research (with a focus on Germany), we then present recommendations to ensure AI promotes inclusion and social cohesion.

Scenario 1: AI Risks Widening the Divide

Unequal Access and Usage: Early evidence suggests that AI tools like generative AI are more readily adopted by younger, well-educated, and tech-savvy individuals, potentially leaving others behind. In Germany, a recent study on ChatGPT usage found users were typically *younger and better educated*, with higher cognitive engagement and digital skills ¹ ². In contrast, people with lower education, older adults, or those with heavy work and family commitments use such tools significantly less ¹ ³. This indicates a *digital divide* in AI usage: those already privileged (with more education, time, or digital exposure) benefit first and most, while disadvantaged groups lag ⁴. Researchers warn that generative AI is intensifying literacy gaps – not just basic digital literacy, but “*GenAI literacy*” (the ability to understand and use AI systems) ⁵ ⁶. Individuals from lower socio-economic backgrounds often lack access to cutting-edge AI tools or AI education, making it harder for them to acquire these new skills ⁷. Without intervention, this *knowledge gap* could deepen existing inequalities, as AI skills become increasingly important for jobs and daily life.

Educational and Geographic Disparities: The rollout of AI in education and infrastructure is uneven, potentially amplifying regional and socio-economic disparities. For example, European data show a “*digital intelligence divide*” in schools – 44% of German children have tablet access at school versus only 20% in France, correlating with differences in AI learning opportunities ⁸ ⁹. Even within Germany, wealthier or urban districts often enjoy better digital infrastructure and pilot programs for AI in classrooms, while poorer or rural schools lag behind ⁸. This means students in under-resourced communities may not develop AI-related skills at the same pace, affecting their future competitiveness. Felix Ohswald (CEO of an education platform) cautions that lack of access to AI learning can “*push disadvantaged children further behind*”, if their schools cannot immediately offer these tools ⁹. Likewise, small businesses or entrepreneurs in economically marginalized areas struggle to adopt AI due to limited funds, lack of expertise, or weak internet connectivity – missing out on efficiency gains and data-driven insights that larger firms enjoy ¹⁰ ¹¹. In the labor market, companies increasingly value AI competencies; those without access to AI training may find themselves *excluded from job opportunities* in the future ¹⁰.

Bias and Discrimination in AI Systems: Another risk is that AI systems, if not carefully managed, can reinforce social biases and further disadvantage marginalized groups. Germany's Anti-Discrimination Commissioner Ferda Ataman warns that AI can “*make many things easier – unfortunately also discrimination*.” She presented a 2023 report highlighting how algorithmic decision-making in hiring, lending, insurance, or social services can replicate prejudices from their training data ¹² ¹³. For

instance, an automated loan or welfare system might treat someone's postal code as a risk factor – a seemingly neutral criterion that *proxies for origin or ethnicity if certain districts are populated by migrant families* ¹⁴ ¹⁵ . This kind of statistical bias led to real harms abroad: a Dutch algorithm erroneously flagged thousands of dual-nationality parents for fraud in a child benefits scandal ¹⁶ ¹⁷ . Similar issues could arise in Germany if AI tools rate disadvantaged applicants as “less suitable” based on biased correlations. Left unchecked, “*prejudice in algorithms can work to further entrench systemic racism or sexism,*” as researchers note ¹⁸ . Moreover, those who already face disadvantages (e.g. ethnic minorities, immigrants, women in male-dominated fields) might lack the means to contest or even detect such algorithmic bias. This “*black box*” nature of AI decisions makes it hard for affected people to understand why they were disadvantaged and to fight back ¹⁹ ²⁰ .

Resulting Inequities: If Scenario 1 dominates, the overall effect would be growing inequality. The most privileged groups and regions harness AI to boost productivity and education, pulling further ahead in wealth and skills. Meanwhile, disadvantaged communities risk a double burden: *less access to beneficial AI tools and greater exposure to AI-driven biases*. For example, higher-income professionals can use AI assistants to automate work and increase earnings, while lower-income workers may be displaced or miss out on AI-driven job opportunities ¹⁰ . Students in elite schools might excel with personalized AI tutoring, whereas others fall behind with outdated resources ⁸ ⁹ . On the societal level, these trends threaten social cohesion – a “*have vs. have-not*” divide where technology exacerbates existing social fractures. Policymakers and experts in Germany acknowledge this risk: without deliberate action, AI advancements could *reinforce broader socioeconomic inequalities* that map onto education, age, income, gender, and migration background ²¹ ⁷ .

Scenario 2: AI as a Tool for Inclusion and Empowerment

Despite the risks, AI also holds promise to **bridge gaps and support disadvantaged communities** – if its power is applied thoughtfully. There are growing examples of AI being used to overcome language, education, and accessibility barriers, which are highly relevant in Germany's diverse society.

Language Assistance for Immigrants and Refugees: AI-powered translation and communication tools can dramatically help those with migration backgrounds. A case in point is *Capiche*, an AI-based language assistant developed in Germany to support refugees ²² . Capiche combines machine translation with crowd-sourced knowledge to handle languages like Arabic, Persian, or Tigrinya – languages not well served by common voice assistants ²³ ²² . Integrated with the Handbook Germany information portal, it lets refugees ask questions in their native language and get reliable answers in real-time, while filtering out misinformation or extremist content ²⁴ ²⁵ . This helps newcomers navigate everyday needs (e.g. understanding official websites, brochures, or forms) without waiting for human interpreters. By *breaking down language barriers*, such AI tools speed up integration: refugees can more easily find jobs, access healthcare, learn about local laws, and communicate with authorities ²⁴ ²⁶ . The developers note that Capiche “*helps to overcome language barriers and promote integration*” – even reducing costs and delays for public services by providing multilingual access to information ²⁷ ²⁶ . In everyday practice, many immigrants in Germany already use AI translation apps (like Google Translate or DeepL) to read German documents or converse with German speakers. As AI translation improves, it *empowers non-native speakers* to participate more fully in society, from parent-teacher meetings to starting a business, despite not yet mastering German.

Educational Support for Those with Weaker Trajectories: AI can also function as a personal tutor or writing assistant, *helping people overcome educational gaps*. Generative AI language models, such as ChatGPT, have shown potential in leveling the playing field in education. In an interview about AI in schools, Prof. Enkelejda Kasneci of TUM argued that tools like ChatGPT offer “*big opportunities for the*

empowerment of previously disadvantaged people” and can *“lead to greater educational equity.”* ²⁸ . For example, anyone with internet access can learn about almost any subject through AI chatbots, regardless of the quality of their local schools ²⁹ . AI writing assistants can help students (or adults) who struggle with literacy or formal writing to express themselves more clearly. Kasneci notes that ChatGPT can help people *“who otherwise have difficulty [writing]... for example due to a disability,”* thus giving them new chances to participate in society ²⁹ . In schools, AI could personalize learning: a student weak in essay writing could get instant feedback and suggestions on improving grammar and style, almost like having a one-on-one tutor ³⁰ . In fact, a small study in a multicultural classroom found that migrant teenagers using ChatGPT to refine their German writing *improved their vocabulary and grammar* significantly ³¹ ³² . The AI provided a corrected version of their essays, which the students could learn from and then produce better writing themselves. Such tools can especially help students from non-academic or non-German-speaking homes to catch up with peers by practicing language skills in a low-stress, individualized way. Beyond language, AI can generate practice questions or explain concepts in math, science, etc., functioning as a *“study partner”* for those who cannot afford private tutoring ³³ . Over time, this kind of support can mitigate educational disadvantages linked to poverty or migration history.

Improving Access to Services: AI is also being deployed to make public services more accessible to marginalized groups. Governments and civic tech initiatives in Europe are exploring *“one-stop shop”* digital platforms to guide people through bureaucracy and social services ³⁴ ³⁵ . For instance, the city of Cluj (Romania) created a multilingual portal for migrants to find information on jobs, housing, healthcare, and more, all in one place ³⁶ ³⁷ . The site plans to incorporate AI-driven live chat, so users can ask questions and get instant guidance, simulating an assistant that is available 24/7 ³⁸ . In Germany, one can imagine similar AI chatbots helping citizens fill out forms (e.g. for social benefits or residency permits) by answering questions in plain language or in multiple languages. This would be especially helpful for those with limited German or low literacy, who currently struggle with complex official language. There are also AI initiatives targeting specific needs: for example, **AI-powered legal aid** can help low-income individuals understand their rights and even draft letters or applications. In the German context, where paperwork can be daunting, an AI assistant could *walk a migrant through the steps of registering for healthcare or a child's school*, ensuring they don't miss out on services due to confusion. Some German agencies have started experimenting with AI for administrative efficiency (such as the Federal Office for Migration using AI to recognize dialects in asylum applications), but the same technology could be repurposed to assist applicants in preparing their files or translating requirements ²⁴ ³⁹ . When designed with inclusion in mind, AI can thus *serve as a bridge* between disadvantaged communities and the institutions that serve them.

Assistive Technology and Accessibility: Another dimension of inclusion is how AI benefits people with disabilities or special needs, many of whom face socio-economic disadvantages. AI-driven assistive technologies can vastly improve quality of life and inclusion – for example, *speech recognition and image recognition powered by AI allow blind or visually impaired people to interact with the world more easily*, and real-time captioning or translation helps the deaf communicate. Generative AI is now fueling a new wave of assistive tools, from smart prosthetics to apps that adapt digital content to a user's needs ⁴⁰ ⁴¹ . In education and the workplace, these tools can level the playing field for individuals with impairments. Germany has a growing market of assistive AI devices (sometimes supported by public health insurance or grants) aimed at helping disabled and elderly citizens maintain independence ⁴² . By supporting those who might otherwise be marginalized, AI-enabled assistive tech promotes *greater social and economic participation* of people with disabilities.

Social and Community Applications: Finally, AI can empower community organizations and NGOs that support disadvantaged groups. For example, NGOs can use AI data analysis to identify which neighborhoods need the most support, or to personalize coaching for job-seekers from

underrepresented backgrounds. Charities working with refugees in Germany might employ AI translation (as Tarjimly does globally) to connect volunteers and refugees on-demand. Community centers could use AI to generate easy-to-read summaries of news or political information, helping people with limited education stay informed. These emerging uses demonstrate how, in Scenario 2, AI becomes a *great equalizer*: providing capabilities and knowledge to those who need it most, and helping to reduce cultural and socio-economic gaps rather than widen them.

Recommendations for Inclusive AI Benefit

To ensure disadvantaged communities in Germany profit from AI – and that society moves toward Scenario 2 (inclusion) rather than Scenario 1 (exclusion) – a coordinated effort is required. **Government, educational institutions, civil society, and tech companies** all have roles to play in making AI an engine of inclusion and social cohesion. Below is a set of recommendations, addressing different stakeholders:

1. Invest in Digital Infrastructure and Access for All (Government)

The foundation is ensuring *affordable access* to AI tools and the internet. Government programs should continue expanding high-speed internet and device access in underserved areas (rural regions, low-income urban districts). This includes fully funding initiatives like Germany's *DigitalPakt Schule* (which upgrades school tech infrastructure) and extending them to community centers and libraries in disadvantaged neighborhoods ⁴³ ⁴⁴. **AI tools and services should be treated as basic utilities** – the German government already envisions providing AI resources as part of basic public services ⁴⁵. In practice, this could mean offering public AI access points or free subscriptions to educational AI platforms for low-income families. Ensuring everyone can log on to and experiment with AI is a first step to preventing an AI-driven divide.

2. Promote AI and Digital Literacy Education (Government & Schools)

To narrow the *GenAI literacy gap*, targeted education programs are essential. Germany should integrate **AI literacy** into school curricula, especially in schools serving disadvantaged communities. This goes beyond coding – it means teaching students *how AI works, how to critically use AI tools, and how to create with AI*. Research emphasizes that inclusive educational initiatives and capacity-building in AI skills are needed to mitigate knowledge divides ⁴⁶. The government's €5 billion AI education investment should prioritize under-resourced schools to ensure they have up-to-date technology and trained teachers ⁴³ ⁸. Outside formal education, community AI workshops or mobile "AI labs" can help unemployed adults, seniors, or migrants learn to use translation apps, chatbots, or other AI services relevant to their lives. **Public-private partnerships** can amplify this effort: for instance, tech companies and universities might collaborate (as TUM and the Roland Berger Foundation are doing) to bring AI-skills training to socially disadvantaged youths ⁴⁷ ⁴⁸. By equipping marginalized groups with AI skills and understanding, we empower them to utilize these tools instead of being left behind. As the PLOS study concluded, "*providing training and educational opportunities is essential to empower individuals and communities to effectively utilize and derive benefits from [AI] services.*" ⁴⁹

3. Design AI Tools with Inclusive Features (Tech Industry)

AI developers and companies should build products *with disadvantaged users in mind*. That means incorporating **multi-language support**, intuitive interfaces, and low-bandwidth functionality into AI tools from the start. For example, chatbots or government AI apps in Germany should support not just German and English, but also Turkish, Arabic, Russian and other common migrant languages, as well as easy-to-understand German for those with limited literacy. AI systems must also be accessible for

people with disabilities (compatible with screen readers, voice-controlled for those who cannot type, etc.) ⁵⁰ ⁵¹ . Tech companies should conduct user research within various communities – including immigrants, the elderly, and people with disabilities – to tailor their AI’s *prompting and response style* to different needs (e.g. simpler explanations, or culturally relevant examples). Importantly, **addressing algorithmic bias** is part of inclusive design. Firms need to audit and improve the diversity of their training data, so AI services work fairly for all demographics. This could involve adding more data from underrepresented groups, as well as bias mitigation techniques. As one industry analysis notes, “*left unchecked, prejudice in algorithms*” can perpetuate inequality, so tech companies must actively work toward “*fairer representation of marginalized communities in AI datasets.*” ⁵² ⁵³ . Concrete actions include hiring diverse development teams and consulting external experts (e.g. ethicists or community advocates) to review AI systems for unintended discrimination. An inclusive AI tool is **one that the disadvantaged can use easily and safely**, without needing advanced training or fearing negative bias.

4. Strengthen Regulatory Oversight and Ethical AI (Government)

The government should establish clear rules and oversight to prevent AI from harming disadvantaged groups. Germany can build on the EU’s upcoming AI Act by enforcing **transparency and accountability** for AI systems used in sensitive areas like employment, finance, policing, or social services. Ferda Ataman’s recommendations are instructive: require companies and agencies to disclose what data and criteria their AI uses, and set up an *arbitration or ombudsman office* where individuals can challenge AI-driven decisions that they feel are discriminatory ⁵⁴ ⁵⁵ . German law (e.g. the General Equal Treatment Act) may need updates to cover algorithmic bias explicitly, ensuring that *people have the right to non-discrimination by AI* just as by a human decision-maker ⁵⁶ . Government and independent researchers should continuously monitor for “*digital discrimination*” – for instance, testing AI systems for redlining (such as the postal code proxy issue) or bias against ethnic names in hiring. When problems are found, regulators must enforce corrections or penalties. Additionally, data protection and privacy laws must be upheld strongly, since disadvantaged communities could be especially vulnerable to misuse of their data or AI-driven surveillance. Overall, a robust ethical framework will increase trust that AI can be used by all safely. As Ataman put it, “*Digitization is the future. But people must be able to trust that they will not be discriminated against by AI.*” ²⁰ Clear rules and recourse help build that trust.

5. Support Community-Led AI Solutions (NGOs & Local Government)

Civil society organizations and local authorities should play an active role in bridging the AI gap on the ground. **NGOs can implement training and toolkits** to help disadvantaged groups leverage AI for their specific needs. For example, migrant support centers could run workshops on using translation apps or AI job application assistants. Disability advocacy groups might curate and distribute the best AI assistive apps (for learning, communication, etc.) to their communities. There is also room for social enterprises to develop AI solutions *for local challenges*: in Germany, a civic tech group could create an AI chatbot that helps immigrants fill out residence permit forms, or an AI mentor for at-risk youth that guides them in career planning. Funding for such grassroots innovation could come from government grants or corporate social responsibility programs. The advantage of community-led solutions is that they are *designed with direct input from the target group*, ensuring cultural relevance and addressing intersectional needs (for example, a project might focus on Turkish-speaking women in a certain city, tailoring content accordingly). Local governments should partner with libraries, adult education centers, and job centers to provide *on-site AI access and training*, possibly via volunteers. One notable idea is setting up “**AI help desks**” in community hubs – a place where anyone can come and get assistance in using an online form, writing a letter, practicing German with an AI tutor, etc. These initiatives echo the concept of digital inclusion as “*a gateway to integration*” ⁵⁷ : by ensuring migrants, low-income families, and other marginalized folks can confidently use digital tools, we enable them to participate more fully in economic, social, and civic life ⁵⁸ .

6. Encourage Ethical Innovation and Inclusive Business Practices (Tech Companies & Startups)

Tech companies in Germany should be encouraged (and rewarded) to develop **AI for good** products that focus on social inclusion. This might include AI-driven education platforms for students with learning difficulties, hiring tools that actively reduce bias, or financial AI services that help low-income users budget and access benefits. The startup ecosystem can be nudged through challenges and accelerators on “*AI solutions for inclusion*,” possibly funded by government or EU programs. Larger companies can contribute by open-sourcing language models or datasets for less-resourced languages (e.g. Kurdish or Farsi, which many refugees speak), allowing more applications to be built for those communities. Tech firms should also adopt *inclusive business models*: for instance, offering free or discounted AI services to non-profits and schools, or implementing **universal design** so their mainstream products cater to a wide range of users by default. An example is providing a “simple mode” in a banking app that uses AI to explain financial terms in plain language – useful for both the less-educated and those with cognitive disabilities. Finally, companies should engage with regulators and academics to stay ahead of ethical issues. Participating in forums on AI ethics, sharing best practices on DEI (Diversity, Equity, Inclusion) in AI development, and conducting impact assessments for new AI deployments will all contribute to a *more socially conscious tech sector*. In the long run, this reduces the risk of backlash (legal or public) and ensures AI’s benefits are widely shared.

7. Inclusive AI Strategies at the National Level (Government & Stakeholders)

Germany can integrate the above measures into a **national strategy for AI inclusion**. This means explicitly acknowledging in its AI strategy documents that *social cohesion and equal opportunity* are key goals alongside innovation and economic growth. The national AI strategy should set targets – for example, increasing AI literacy among women, older adults, and immigrant communities by a certain date, or ensuring that a percentage of AI research funding goes to projects addressing societal challenges. It could also mandate *impact assessments on inequality* for major AI initiatives. Germany’s approach can draw from EU frameworks and global best practices (UNESCO and OECD have guidelines on AI for inclusive education and public services ⁵⁹). By tracking metrics (such as AI usage rates across different demographics, or the reduction in algorithmic bias incidents), the government can measure progress and adjust policies. Crucially, disadvantaged communities must have a seat at the table in crafting these strategies – through consultations with community organizations, surveys, and including diverse voices on AI advisory boards. This aligns with the principle that those who are usually “left on the periphery” of tech developments should be *actively involved in shaping* how AI is rolled out in society

60 6 .

Conclusion

AI’s role in society can either reinforce existing inequalities or help overcome them. In Germany, as in many countries, we see early signs of both scenarios. On one hand, well-off and educated groups are pulling ahead in AI adoption, raising concerns about a new **digital divide** in AI capabilities ¹ ⁴. On the other hand, innovative uses of AI – from translation services for refugees to personalized learning tools – demonstrate how technology can **empower the underprivileged** ²⁴ ²⁸. The outcome will depend on conscious efforts by all stakeholders to steer AI in an inclusive direction.

By implementing the recommendations above – investing in broad access and literacy, designing technology for diversity, regulating against harm, and fostering community-centric solutions – Germany can maximize AI’s benefits for socio-economically and culturally disadvantaged communities. Done right, AI tools could *help migrants overcome language barriers, assist students who struggled in traditional*

systems, enable persons with disabilities, and give every citizen easier access to information and services. This would not only improve individual lives but also strengthen social cohesion, as more people would be equipped to contribute their skills and voices in the digital age. In sum, AI need not be a privilege of the few; with inclusive policies and design, it can be a **public good** that uplifts the many, helping bridge divides rather than widen them.
